

# WEBER CARBURETTORS

## LINKAGES FOR DCOE CARBURETTORS

Webcon UK Limited announce our own designs and layouts of linkage for DCOE and DCO/SP carburettors. These have:

**the following versatile features:-**

- Different versions for fitting above or below the carburettors.
- Different versions available for single or twin cable operation.
- All can be used on single or twin carburettor installations (for in-line engines)
- All can be fitted with the cable routed from either side.

**the following safety features:-**

- Fitted with adjustable over-centre stop.

- Twin return springs.
- Twin sintered bronze self-lubricating quadrant bearings.
- High quality 8mm steel ball joints.

**and the following other features:-**

- Inner cable connects to quadrant cam for smooth linear action.
- Light weight construction fabricated in zinc-plated steel, which matches existing steel components on the carburettor.
- Adjustment for throttle cable movement from 22mm to 40mm.
- Complete with all fitting accessories and a set of instructions.

Contact your nearest Weber dealer  
for sales and service.

**The four versions available are:-**

- LP 1000 Top mounting for single cable operation incorporates clamp-on ferrule for use with existing throttle cable.
- LP 2000 Top mounting for twin cable operation, kit includes twin cables.
- LP 3000 Bottom mounting for single cable operation incorporates clamp-on ferrule for use with existing throttle cable.
- LP 4000 Bottom mounting for twin cable operation, kit includes twin cables.

## GENERAL NOTES ON INSTALLATION

1. It is preferable where possible to fit the throttle levers supplied, to the carburettor(s) before installation, and ensure that the throttles open and close freely prior to connecting the throttle linkage.
2. On twin carburettor installations the linkage body can be mounted on either carburettor to suit each application to allow the best accelerator cable route to be chosen.  
**N.B.** The linkage must be mounted so as to operate the chosen throttle lever between the two carburettors, (i.e. not on the outer end of one spindle).
3. Measure the accelerator cable travel on the existing installation, to assist in correctly adjusting the new linkage.
4. Lubricate the linkage with light oil during assembly.

---

## THROTTLE LEVER FITMENT - Twin Carburettor Installation

**N.B.** It may be necessary in certain installations to remove the cast section of manifold between cylinders 2 & 3 to allow clearance for the new levers (1 & 2).

- a. Fit the new throttle levers (1 & 2) supplied, to the inside (facing) ends of the two carburettor throttle spindles. Lever (1) fits the throttle spindle on the fuel union side of the carburettor.  
**N.B.** Fit shim washers (3) as required behind lever (1), do not fully tighten the spindle nut until the correct shimming is obtained. Ensure the original plain washers are fitted to the outer ends of the throttle spindles. Secure the throttle spindle nuts with the new lock tabs (4) provided.

## THROTTLE LEVER FITMENT - Single Carburettor Installation

- a. Fit either of the two throttle levers (1 & 5) provided, to the carburettor, dependant on right or left hand actuation. Lever (1) fits the throttle spindle on the fuel union side of the carburettor. Ensure the original plain washer is fitted to the opposite end of the throttle shaft.

## LINKAGE ASSEMBLY INSTALLATION

- a. Connect the link rod (6) to the throttle lever on the carburettor.
- b. Secure the base plate (7) supplied to the carburettor float chamber cover (LP1000/2000) using the three longer screws (8) and spring washers (9) supplied, or to the float chamber drain plate (LP3000/4000) using the original screws.
- c. Secure the linkage body (10) supplied to the base plate (7), and secure using the two M6 Nyloc nuts (11) with plain washers (12).
- d. Connect the remaining end of the link rod (6) to one of the five positions on the crank lever (13), dependant on the accelerator cable movement. The range covers 2640mm of cable travel.
- e. Fit the crank lever (13) to the linkage body (10) using the pivot pin (14) supplied, select the pivot pin position which offers the best link rod alignment.
- f. Secure the pivot pin (14) using the M5 plain washer (15) and M5 nyloc nut (16) provided.  
**N.B.** Do not overtighten the nyloc nut (16).
- g. Fit the over centre stop screw (17) and nut (18) provided.
- h. Fit the two throttle return springs (19) as shown, retain using the two remaining M5 plain washers (15) and split pins (20) provided.

## ACCELERATOR CABLE CONNECTION (Single Cable)

- a. Screw the outer cable adjuster sleeve (21) into the linkage body as show
- b. Slide the existing accelerator cable through the adjuster sleeve (21) and secure the inner cable to the crank lever (13) using the adjustable ferrule (22).

## ACCELERATOR CABLE CONNECTION (Twin Cable)

- a. Fit the connector block (23) provided to the accelerator pedal at the required position from the pedal pivot.
- b. With the accelerator pedal in the idle position mark out on the bulkhead the positions for the two diameter 6.5 holes 20mm apart.
- c. Drill through the bulkhead and fit the cable sleeves (21), support washers (24) and secure using the spare M6 nuts (25) provided.
- d. Route the twin cables (26) from the linkage through the bulkhead and secure to the pedal using the previously fitted connector block (23).
- e. Retain the cables where necessary using the cable ties (27) supplied.

## ACCELERATOR LINKAGE ADJUSTMENT

- a. Adjust the link rod (6) so that the crank lever actuating arm travels an equal distance above and below the horizontal axis, when traversing from idle to full throttle.  
**N.B.** The angle between the crank lever actuating arm and the link rod (6) in the full throttle position must not be less than 20 degrees.
- b. With the carburettor in the full throttle position adjust the limit stop screw (17) on the linkage body to meet the crank lever (13), fully tighten the lock nut (18).
- c. Adjust the outer cable so that the accelerator pedal reaches its limit stop as the carburettor reaches full throttle.  
**IMPORTANT:** Check the throttle operation before starting or road testing the vehicle.

**NOTE: IT IS THE RESPONSIBILITY OF THE INSTALLER TO ENSURE THAT THIS LINKAGE IS SET AND FUNCTIONING CORRECTLY, AND THAT THE OVER CENTRE STOP WILL NOT ALLOW THE LINK ROD AND ACTUATING ARM TO BECOME IN-LINE.**
